

Victor Glass

Computer Engineering Student | Embedded Systems | Controls & Automation

vg67@uakron.edu • (440) 661-0575 • www.linkedin.com/in/victor-glass

U.S. Citizen | Security Clearance Eligible

EDUCATION:

The University of Akron - Akron, OH

Expected May, 2028

- Williams Honors College GPA: 3.38/4.00
- Relevant Coursework: Embedded Systems, Signals & Systems, Physical Electronics, Computer Systems Design, Circuits II, Digital Logic Design

TECHNICAL SKILLS:

- Embedded & Controls: STM32, PIC24, Siemens TIA Portal / PCS7, Rockwell Studio 5000, PROFINET
- Programming: C, C++, VHDL, IEC 61131-3 (Ladder Logic, FBD, SFC), MATLAB, Python
- Software: AutoCAD Electrical, Quartus Prime, KiCAD, GNU Radio, Multisim, MS Office

EXPERIENCE:

rpGatta Inc, Aurora, OH

May – August, 2026

Controls Engineering Co-op

- Developed and prepped for site deployment two automated machine vision inspection stations by programming Siemens S7-1500 controllers, integrating Keyence vision sensors via PROFINET.
- Integrated new inspection functionality into an existing production system by developing HMI interfaces and communication logic while preserving existing sequencing and safety interlocks.
- Enabled reliable automated inspection across multiple part variants by designing control logic to manage vision system configuration, inspection sequencing, operator interaction, and fault handling.

RoviSys Inc, Aurora, OH

August – December, 2025

Systems Engineering Co-op

- Implemented a PID-based thickness control strategy for an industrial flaker system using Rockwell Studio 5000 (PlantPAx), supporting automatic thickness, pressure, and manual operating modes.
- Translated customer requirements, process narratives, and P&IDs into Siemens PCS 7 control implementations, hardware configurations, and technical documentation.
- Configured distributed control hardware, CFCs, SFCs, WinCC graphics, I/O assignments, and engineering documentation across multiple automation projects.

PROJECTS:

Software-Defined QPSK and 16QAM Implementation – 2-person Project

- Implemented end-to-end wireless QPSK communication between NI USRP-2922 and Ettus N210 software-defined radios using Python and GNU Radio, including packetization, modulation, synchronization, demodulation, and data recovery.

STM32 & PIC24 Embedded Development

- Developing embedded applications in C on STM32 and PIC24 microcontrollers using GPIO, timers, interrupts, and peripheral interfaces.

FPGA Digital Logic Projects

- Implemented projects in VHDL, including a PWM-based tri-color LED driver and finite state machine-based traffic light controller.

DESIGN TEAMS:

UA Akronauts Rocket Design Team

September 2026 – Present

- Researched and selected antenna and battery hardware for line-of-sight tracking.
